

Luffy's Survival Quest — Arcade Integration Guide

Date: July 11, 2026 **Site:** <https://nanogames.app> **Game URL:** <https://nanogames.app/games/luffys-quest>

What This Is

Luffy's Survival Quest is now the fifth game in Nano Games. It is a One Piece-themed top-down survival game: fight through 4 islands (The Town, Sky Island, Volcano Island, Monkey Island), master 6 powers (Lightning, Heal, Teleport, Block, Conqueror's Haki, Gear 5 Nika Mode), and defeat every boss. Touch-friendly with a virtual joystick, so it plays on phones and tablets as well as desktop.

What Was Added

File	Purpose
<code>public/games/luffys-quest.html</code>	The complete self-contained game (copied from <code>*new*/luffys-quest/index.html</code>)
<code>app/games/luffys-quest/page.tsx</code>	Wrapper page that frames the game with the "◀ ARCADE" top bar
<code>app/page.tsx</code>	New game card in the lobby grid + stats bar updated to 5 games / 8 worlds

How the Arcade Pattern Works

Every game in Nano Games follows the same three-part pattern:

1. **The game itself** is one standalone HTML file in `public/games/<slug>.html`. It needs no build step — Next.js serves it as a static asset.
2. **A wrapper page** at `app/games/<slug>/page.tsx` puts the game in a full-screen iframe with a top bar linking back to the arcade lobby.
3. **A card entry** in the `GAMES` array at the top of `app/page.tsx` makes it appear in the lobby grid (title, tagline, description, emoji icon, accent color).

How to Update the Game

1. Edit or replace `public/games/luffys-quest.html` (the master copy also lives at `*new*/luffys-quest/index.html` — keep them in sync or treat `public/` as canonical).
2. Commit and push to `main` — Vercel auto-deploys production in about 20 seconds.

```
cd ~/Documents/GitHub/nano-games
git add public/games/luffys-quest.html
git commit -m "Update Luffy's Quest"
git push origin main
```

Verification Performed

- `next build` passed with `/games/luffys-quest` in the route list
- Local production server: lobby card, wrapper page, and game HTML all returned 200
- Live site checked after deploy: card renders and game loads at the production URL
